statistics education Category: statistics articles with year of disambiguation1. Field of the Invention The invention generally relates to a method and apparatus for verifying the performance of devices in a computer system. More particularly, the invention relates to a method and apparatus for verifying the performance of a plurality of input/output devices which are controlled by a plurality of ports of a computer system. 2. Description of the Related Art The performance of a computer system is dependent on several factors. One of these factors is the performance of the input/output (I/O) device that is attached to the

computer system to provide communication between the computer system and a peripheral device. Therefore, in order to improve the performance of a computer system, it is important to measure the performance of the I/O devices that are attached to the computer system.

One technique that is used to measure the performance of the I/O devices is to verify the performance of the I/O devices after the I/O devices have been connected to the computer system. A problem that may occur with this method is that there may be no record of the performance of the I/O devices during the period before the I/O devices were connected to the

computer system. This may occur when the I/O devices were connected to the computer system at a time when the performance of the I/O devices was not known to the user or when the I/O devices were reworked after the computer system was configured, which may result in data that is stored in the I/O device or by a system timer that is based on the performance of the I/O device before the I/O device 2d92ce491b
